The purpose of this research is to study "Legal Aspects of Conservation, Use and Development of Biological Diversity in Thailand" The issue reserves serious consideration due to various reason, Firstly, We are massively of utilizing biological resources : flora, fauna and micro-organism for agricultural purposes, industrial productions and pharmaceutical Secondly, Thailand is in tropical forest zone which is flourished with biological diversity resources. Lastly, Thailand is being a member country who will have to give ratification for the Convention on Biological Diversity 1992. As the convention agrees to include the patent system ^{as} a condition for the access to transfer of technology, this implies a hidden agenda of extending patents system to the cover invention of flora, fauna, for and micro-organism under patent system at the same global standard level.

The significance of biological diversity resources in Thailand should be recognized as an important natural resources within the National Social and Economical Development Plan. The practice in administrative management policy making and legislative launching on biological diversity with aspects to protect elements and relationships among biological diversity, is to place these natural resource resources under sovereignty of state with a due recognition of local community and indigenous people's participation in the administrative management and receiving profits from forest should be proceeded.
