

Abstract

Androgenic and aphrodisiac activities of 7 medicinal plants i.e. Do Mai Ru Rom, Krachai, Ma Kratueb Rong, Mai Ku Kudmorn, Gwow Kreur Dang and San Nang Varn were investigated in two kinds of experimental animals i.e. male immature chicks and bilaterally orchidectomized mature albino rats compared with androgen (Mesterolone). The results indicated that every medicinal plant used in this study had no androgenic and aphrodisiac activities in both experimental animals.
