3. Assistant Prof. Ratana Karnjanapun

The purpose of the research is to study the spread of drug abuse in governmental secondary school in Bangkok to compare with the factor of the spread of Ministry of Education of drug abuse and the experience about using it by dividing the students which depends on their conditions.

The group of students to study is 210 in secondary and high school students which all of the are the ones who may use the drug abuse and some of them are not. We select a random sample of students with stratified random sampling type and we do this by interview which there are their status at that time, their opinions about the experience of using drug abuse and the factor of the spread of drug abuse in school. After that we received the interview form 209 which is 99.52%.

We took them to analyse by the instant program SPSS/ PC+ (Statistical Package the Social Science / Personal Computer Plus) by figuring as percentages,

classify the frequency and arrange in good order and compare with the condition of the sample group per the experience in using the drug abuse of students and the factor to the spread of drug abuse in secondary school by using Chi-Square

We found that the result of the research about the factor which effects to the spread of drug abuse in secondary concerns with smoking, drinking alcohol, former drug students force the present drug students to sell. The drug student will persuade the others to use drug abuse. And the experience of using the drug abuse, the method of using it which cover of drug abuse with many students like to begin. These factors, there are different which depends on sex, level and the arrangement of child of their family, other conditions which effect to the spread of drug abuse not be different.
