Abstract

The purpose of this research was to study the information of students in the secondary school for adviser to consider helping and taking care students and to instruct the computer program that collect information and link the information from the secondary school's database. The subjects were 5 advisers at Mathayom Suksa 5 in Saraphipittayakhom School, Saraphi district , Chiang Mai Province by accidental sampling.

The administration information system of the students in Mathayom Suksa was analized and the computer program was instructed for developing and installing in Saraphipittayakhom School. The advisers then used the computer program and were interviewed. The data were cataloged and analized for description.

The results were as follows:

1. The information that the advisers in secondary school used consist of (1) Individual history (2) Health (3) Behavior (4) Lesson plan
2. The computer program could help the advisers in the secondary school to search the information quickly and conveniently to follow up and take care students very well.
