PROGRAM FOR APPLICATION PROGRAMS VIA THE WINDOW SYSTEM. THESIS
ADVISOR : CHARUMATR PINTHONG. 66 pp. ISBN 974-634-990-2

This research is about the program that interfaces between the two application programs running on separate computers. The first application program runs on a host computer that can be accessed remotely via Telnet protocol. The second application program runs on another host computer or a personal computer using Microsoft Windows operating system. This interface program can transfer text data between two application programs automatically using predefined positions. Those positions can be defined on the remote virtual terminal screen created by Telnet protocol. The program is developed using Borland Pascal language and contains 5 modules (1) general module (2) display module (3) telnet protocol module (4) terminal emulation module (5) connection module. The researcher found that the interface program can transfer data between two application programs accurately.
