This study was designed to find the factors that would be significantly related to court sentences in psychotic homicide. 60 patients were selected by purposive sampling techniques. Data collection were made by case review from the inpatient charts and court sentences. Data analysis by computerized programme, SPSS/PC and stepwise multiple regression to demonstrated the relationship of each variables. We found that confession during the trial, brutal commitment and physician's opinion and clinical diagnosis had the statistically significant relationship with court sentences in psychotic homicide.
