### Abstract

The effect of Pb addition on superconductivity of the high  $T_c$  superconductor  $\text{Bi}_2\text{Sr}_2\text{Ca}_2\text{Cu}_3\text{O}_z$  was studied by preparing  $\text{Bi}_x\text{Pb}_y\text{Sr}_2\text{Ca}_2\text{Cu}_3\text{O}_z$  using solid reaction method. The starting compounds were  $\text{Bi}_2\text{O}_3$ ,  $\text{PbO}_2$ ,  $\text{SrCO}_3$ ,  $\text{CaCO}_3$  and  $\text{CuO}$  with atomic composition ratio of  $\text{Bi} + \text{Pb} : \text{Sr} : \text{Ca} : \text{Cu} = 2 : 2 : 2 : 3$ . The well - mixed powder was calcined at temperatures in the range of  $830 - 840^\circ\text{C}$  and then pressed into pellets. These pellet samples were consequently sintered at temperatures between  $830 - 960^\circ\text{C}$ . It was found that these samples showed Meissner effect at temperatures above the boiling point of liquid nitrogen. Also, the critical temperature ( $T_c$ ) was observed to be dependent on Pb quantity in the sample. However, the maximum  $T_c$  was  $107.1\text{ K}$  when  $x = 1.4$  and  $y = 0.6$ . The crystal structure of this sample was identified by means of X - ray diffraction to be tetragonal, with lattice parameters  $a = b = 5.41 \text{ \AA}$  and  $c = 37.42 \text{ \AA}$ .
