At present, damage caused by building construction becomes more frequent. The amount of damages incurred to the property is usually tremendous, and the loss of lives and injury which is invaluable are always counted as part of such damage. This research focuses on the studies of legal liability of the persons who works in civil engineering profession and the studies of problems in criminal proceedings by the agencies governing professional conduct and the administration of justice for the offences relating to working in civil engineering profession.

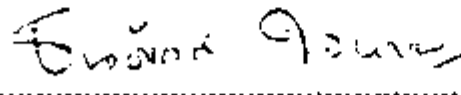

The result shows that the laws governing civil engineering profession concentrate on dealing with the prevention of crimes committed by the persons working in civil engineering profession. Furthermore, the present legal measures against the persons committing offences arising from working in civil engineering profession under the Penal Code are not quite effective due to the fact that the criminal proceedings for such offences are much complicated than those for other kinds of offences.

This thesis proposes that the laws governing civil engineering profession should be revised. It also suggests that the legal measures against crimes arising from professional misconduct should be implemented.
