The objective of this descriptive research was to study bio-
psychosocial factors co-existed with depression and prevalence of
depression in women attending menopausal clinic at Chulalongkorn
Hospital. There were new cases of 113 women, age 40-59 years
visiting menopausal clinic at Chulalongkorn Hospital during
June-September 1996. CES-D (Center for Epidemiologic Studies
Depressive Symptomatology Scale) and interviewing forms regarding
psychosocial factors were used as the measurements.

The results of the study showed that:

1. Factors that had been significantly co-existed with
depression in women attending menopausal clinic at
Chulalongkorn hospital were :
 - 1.1 Severity of menopausal symptoms (at .01 level).
 - 1.2 Life stress events, social support, personalities
and attitude toward menopause (at .001 level).
2. The prevalence of depression (cut of score at 16) in
women attending menopausal clinic, Chulalongkorn Hospital was 31
percent.
