Topic: Sustainability Assessment of Biofuels for Transport in Thailand

Name of student: Mr. Thapat Silalertruksa Student ID: 50920113

Name of Supervisor: Prof. Dr. Shabbir H. Gheewala

### Abstract

**E42132**

The dissertation aims to assess the sustainability of biofuels for transport in Thailand by focusing on the four key issues related to their production and use i.e. environmental consequences, full cost performance, long-term security of feedstocks supply and socio-economic impacts. A variety of environmental and economic assessment tools and indicators including net energy balance (NEB), life cycle assessment (LCA), life cycle costing (LCC), externalities assessment based on benefits transfer approach, net feedstock balances, Shannon index, net life cycle greenhouse gas (GHG) emissions and economic input-output (IO) analysis are applied in the study to evaluate the existing biofuels production systems in Thailand i.e. cassava ethanol, sugarcane molasses ethanol and palm biodiesel. The results are discussed as follows:

NEB and LCA show that there are significant differences in energy and environmental performance between the existing production systems even for the same feedstock. The differences are dependent on many factors such as farming practices, feedstock transportation, fuel used in biofuels plants, operation practices and technology of biofuels conversion and waste management practices. In addition, land-use change (LUC) is an important factor in the GHG performance of the first generation biofuels in Thailand as they can possibly increase from 1 to 10 times compared to the cases where LUC is excluded. Therefore, biofuels will contribute to the country's strategic plan on GHG mitigation in the transportation sector only if the production systems are sustainably managed.

LCC and preliminary assessment of externalities of gasohol reveal that in comparison to gasoline at the same performance, the total environmental costs of cassava based ethanol are 6% to 32% lower, depending on the blending level of ethanol into gasoline. However, the environmental benefits of various blends of gasohol, i.e. E10, E20 and E85, cannot compensate for their higher production costs as compared to gasoline. The total environmental costs from palm biodiesel are lower than that of diesel by about 3% for B5 and 76% for B100; the total costs of both B5 and B10 are lower than diesel. However, B100 is still not economically attractive and also faces constraints of feedstock availability.

Therefore, several measures to improve the environmental performance and enhance the cost-competitiveness of cassava ethanol and palm biodiesel are required.

For the long-term (future) security of feedstock supply, the results show that only high yields improvement can result in a reliable and sufficient supply of feedstocks to satisfy the long-term demands for biofuels and other related industries. Cassava is identified as the critical feedstock for meeting the future ethanol targets and a reduction in cassava export is necessary. Meanwhile, both increase in fresh fruit bunch (FFB) yields and expansion of new oil palm plantation need urgently to be promoted by the government to avoid the shortage of crude palm oil supply.

In terms of socio-economic development, the results obtained from the combination of analytical approach and IO analysis show that producing bio-ethanol and biodiesel requires respectively about 17-20 times and 10 times more workers than gasoline and diesel per unit energy. Direct employment in agriculture contributes to more than 90% of the total employment. Nevertheless, there are significant differences in the characteristics of employment between persons employed in agriculture and biofuel processing sectors in Thailand. The overall impacts of bio-ethanol production in Thailand in the year 2022 are the generation of employment of around 238,700-382,400 persons-year, 55.5 billion THB additional Gross Domestic Product, imported goods worth 58 billion THB but 93 billion THB of reduced petroleum imports.

Finally, the study concludes that Thailand has a large potential to produce and use biofuels for substituting petroleum fuels for domestic consumption and for trade in the global market. Biofuels have the potential to address climate-change mitigation, energy security and socio-economic development especially for the agricultural sector in rural areas. However, these advantages will only be achieved if the appropriate policy measures as suggested in the dissertation are adopted to direct the biofuels production in Thailand towards sustainability.

Sustainability, Biofuels, LCA, Externalities, Socio-economic, Thailand

## ACKNOWLEDGEMENT

This dissertation report could not be produced without the help and support of many. Firstly, I would like to express my great appreciation to my research supervisor, Prof. Dr. Shabbir H. Gheewala, for his guidance, encouragement and support throughout my Ph.D. study. Secondly, I would like to gratefully thank for financial support from the Joint Graduate School of Energy and Environment (JGSEE), Center for Energy Technology and Environment and the Thailand Research Fund through the Royal Golden Jubilee Ph.D. program (Grant no. PHD/0283/2550). I thank Dr. Masayuki Sagisaka, my co-advisor, and other colleagues at the National Institute of Advanced Industrial Science and Technology (AIST) for their kind supporting and professional advices during the six months that I had conducted my research in Japan. I thank Mr. Uwe R. Fritsche and Dr. Katja Hünecke of the Öko institute, Darmstadt, Germany for their professional advice in the part of socio-economic impacts of biofuels and the global sustainability standards for liquid biofuels production. I thank Dr. Sébastien Bonnet for his guidance and advice in life cycle cost and externalities assessment of biofuels in Thailand. The Thailand Research Fund (DIG5180036) is acknowledged for providing the necessary funds to perform this part of research work.

The research could not be accomplished by without the providing primary and secondary data from many organizations. I thank Mrs Suwanna Tuankaipol of DEDE for the updated policy data of biofuels development in Thailand. I thank Mrs. Chongprode Kodchapoom of the Bangchak Petroleum PLC for palm biodiesel production data. Thanks to the Thailand Environment Institute (TEI) and my colleagues for providing the updated data on bio-ethanol production in Thailand. I thank Dr. Thu Lan T. Nguyen and Dr. Somporn Pleanjai for their dissertations which respectively reveal detailed production data of bio-ethanol and palm oil biodiesel in Thailand. Sincere thanks are also due to Assoc. Prof. Dr. Bundit Fungtammasan and Assoc. Prof. Dr. Chumnong Sorapipatana for their kindness in acting as my Dissertation Advisory committee members. Their comments during each semester at JGSEE are very useful for improving my research work. Also, I would like to thank for the kind advice and comments from the external examiner, Prof. Dr. Matthias Finkbeiner. My thanks are also extended to the support of all staffs and friends at JGSEE. Finally, I wish to take this opportunity of thanking my family and all of my friends for their supporting over the three years that I had studied Ph.D.
