ISBN 974-584-308-3

The purpose of this research was to compare the sincerity of mailed questionnaire responses of elementary school teachers under the jurisdiction of the office of the national primary education commission with different proportion of positive and negative items. The sample were 924 teachers in elementary schools. The mailed questionnaires with different proportion of positive and negative items were used to collect the data for this research. Obtained data were analyzed by means of ANOVA and Z-proportion.

The results were as follow:

The elementary school teachers under the jurisdiction of the office of the national primary education commission responded mailed questionnaires consistently with high sincerity. There were no differences in the sincerity of responses between the teachers who responded the mailed questionnaires which had different proportion of positive and negative items.
