

The purpose of this descriptive study was to describe the opinions of Mae Sariang Hospital Health team towards Universal Health Coverage on model and efficiency of the service. The member of population was 93 officers of health care team of Mae Sariang Hospital. The instrument used was a questionnaire and the data was analyzed by descriptive statistics.

The result of study found that the population agreed with Universal Health Coverage in overall (71 percent); agreed to provide the primary care service (69.8 percent) and agreed that Universal Health Coverage would improve the efficiency of the organization and the people (69.8 percent).

The result of this study reveals that the primary care service should be operated continuously in order to achieve the objective of Universal Health Coverage.
