The developed Thai Graphic Driver for Database Software can serve the
development of any database software that manipulate both Thai/English text
and images. Moreover, the driver will function well without any software and
hardware modification.

The Thai Graphic Driver for Database Software is a terminate but stay
resident program that consists of two major parts: Thai-character handling
part and image handling part. The Thai-character handling part enables the
database software to handle Thai/English input from keyboard, to display and
print Thai/English text properly. The image handling part adds on the image
presenting features. The database software can control image presentation by
sending the specific command to screen. This driver can work with PC
Paintbrush file.
