ABSTRACT

The purposes of the study were to investigate the roles of school nurse teachers concerning the management of school health programs in the secondary schools Bangkok Metropolis, to compare the roles of school nurse teachers concerning the management of school health programs in the secondary schools on the variables of educational background, and to study the school nurse teachers' problems concerning the management of school health programs.

The one hundred and three questionnaires were sent to the school nurse teachers who were population, and eighty-seven questionnaires were returned. It was 84.47 %. The obtained data were, then, statistically analyzed by mean of percentages, means, and standard deviations. Also, the t-test were employed to determine significant differences.

The results indicated as follows :

1. The school nurse teachers who had foundation in nursing and who had no foundation in nursing had the health service roles in the most items to be more frequent practice, but the roles in school environment and health teaching in the most items to be moderate practice.

2. The school nurse teachers who had foundation in nursing had the roles in health service in the most items to be more frequent practice, and the roles in school environment and health teaching in the most items to be moderate practice. The school nurse teachers who had no foundation in nursing had the roles in health service, school environment and health teaching in the most items to be moderate practice.

3. The comparison of the school nurse teachers who had foundation in nursing and the school nurse teachers who had no foundation in nursing had the roles in health service in the most items were significantly different at the level of .05. Exceptionally, the roles in school environment and health teaching in most items were not significantly different at the level of .05.

4. The school nurse teachers' problems concerning the management of school health program in the most items had less problem.
