

Abstract

Title The way approach to water managing to slow down the damage from flood
in Nakornsawan

Field Social – Psychology

Name Mr. Sak Somboonto

Course NDC Class 54

Flood in the year 2011 in Thailand is the most violence over passed 70 years. Since there has been recorded. Nakornsawan is the one was severely damage affected. In the meantime the province tried their best by following the theory of the contingency approach and crisis management to solve the problem during flood situation.

This way produced as a good result after the huge water mass flow over Nakornsawan where also be the economic zone and center point between northern part and center part of Thailand. The province can fix this problem by pumping water out of the government center and economic zone in short period while still have much water around the province. This make Nakornsawan to be the case study for solving and preventing from flood in the later year and become the research named “the way water managing to slow down the damage from flood in Nakornsawan”

The research of implementation based on the theory of the contingency approach and crisis management showed that can restore all private household from critical to original state in the short period.
