SOMPRATHANA RATTHAYANOND : DATA STRUCTURE FOR THAI ELECTRONIC DICTIONARY. THESIS ADVISOR : ASSOCIATE PROF.DR. VILAS WUWONGSE ASSISTANT PROF. SUYUT SATAYAPRAKORB. 90 pp., ISBN 974-581-176-9.

Electronic dictionaries are storages of machine readable lexical items. They are used in advanced word processors for word segmentation and spelling checkers, and natural language processing for syntactic, semantic and discourse analysis. Due to the advancement in computer processing of Thai language, more attention has recently been paid to the development of Thai electronic dictionaries.

This study proposes and develops two frameworks for Thai electronic dictionaries employing double-array digital search tree. The first framework treats a Thai word as a lexical entity and directly applies the double-array digital search tree to store lexical entities. The second one recognizes the fact that many Thai words are composed of few isolated words, and therefore stores a word in terms of a few isolated words, resulting in less storage space. Based on the dictionaries, a Thai word segmentation algorithm has been developed which produces all possible segmentations.

Experiments have been conducted to evaluate performance of the proposed frameworks. It has been found out that it takes more time for the frameworks to retrieve words than the Kasetsart University's approach but they allow the development of simple word segmentation algorithm.
