### **Abstract**

Today computer are used in many military areas but their use in training is still not as extensive as it should be,for example, it use of maps for terrain analysis. But if we use computer constructed maps to help in terrain analysis this can greatly save time and resources

This research is one element of computer usage for analysing two-dimensional contour which display elevation, colour and assist in calculation area. The three-dimensional form has the capability to benefit unit operation and user involved in aircraft tactical support planning by specifying terrain interdivisibility.
