The objectives of this thesis is to study about patterns, factors and various problems which, in fluenced patterns of settlement in Tung Kula Rong Hai area.

It is found in the results of Studying that patterns of communities' settlement in Tung Kula Rong Hai depends on hills or depositional sand where they have lived. The hight of hills is approximate 10-15 metres from former elevation. There are 80-100 rai of area with 15-600 households, depending on history of each community. If they are new communities, they will be small sizes. For old communities, they will be large sizes and more number of households

Patterns of Settlement in Tung Kula Rong Hai are related to natural features, which definid patterns of settlement. Because of the disadvantage of natural features, such as; annual flood, saet soil and lack of water, the people who live in Tung Kula Rong Hai have lower living eondition than other localities.

The result of this study leads to guidelines for development as follow :

- (1) providing of some kinds of trees which stand to drought and salt soil; such as Ukaliptus, for fuel and paper pulp.
- (2) Establishing of industrial plant with local resources, for example; Soda-achplant, which use salt obtained from salty soil and plant for paper pulp which use Ukaliptus trees.
- (3) Tourism promotion which is attracted by drought of the area.
- (4) Organizing of special pattern of government for Tung Kula Rong Hai in order that people in the area will again more chances to participate definiding of their local development directions.
