

Abstract

The study entitled “Preventive behavior from sexual abuse of female teenagers in Bangkok” had the objective of studying demographic, environmental and knowledge of sexual abuse factor which effect preventive behavior from sexual abuse of female teenagers. This study might be used to suggest the measure of preventive behavior from sexual abuse of female teenagers. The sampling were female teenagers who studying at school in Bangkok. The questionnaires were used to collect information from 388 students. The analysis was done by SPSS program. Statistical analysis were percentage, mean, standard deviation and One-Way ANOVA.

The study found that the level of preventive behavior from sexual abuse of female teenagers in Bangkok was high. For demographic factor, it revealed that there were statistical significant difference in three factor which effected preventive behavior ; students' education level, parents' education, and students' hobby. Social environment for female teenagers who were difference experience of risk places also had statistical significant difference. There was no statistical significant difference in the area of knowledge of sexual abuse among female teenagers. However, the level of sexual abuse knowledge in female teenagers was quite high.

As for recommendations from this study, female teenagers should give more attention to their surrounding environment, in particular of the current social situation in order that they will increase their self carefulness. Martial art is suggested to be an alternative as creative activity for maximize. Female teenagers' hobby which can lead to lessen their interesting in male teenagers. In the meantime, The parents should take their role as a guidance to transfer the correct knowledge of how their children can protect themselves whenever they are alone.
