The objective of this experimental reseasch is to determine the efficiency of a structured instructional package developed for teaching basic concepts of music theory.

This study involved the use of one treatment group consisting of 2<sup>nd</sup> year undergraduate students in elementary education at the Phuket Rajabhat Institute. The 41 students, who did not have musical backgrounds, were designated as the treatment group and were taught using this prepared instructional package. These students were tested before, during and after the research, and the results were analyzed.

The results show that the instructional package had an effectiveness ratio of 92.43/84.87, which is higher than the stipulated 80/80. A comparison of the pre-test and post-test results using t- test showed that the students' knowledge of the music concepts increased significantly at the level of 0.01.
