

## Abstract

The study of “The Relationships between Emotional Quotient, Ethics and Adversity Quotient of Politicians : A Case Study of President of Subdistrict Administration Organization in Suphanburi Province.” The proposes of this study are as follows : to study the level of emotional quotient, level of ethics and level of adversity quotient of president of Subdistrict Administration Organization : to study a correlation between emotional quotient, ethics and adversity quotient, and also to construct an equation predicting ethics by using emotional quotient and adversity quotient as predicting variables.

The research population is president of Subdistrict Administration Organization in Suphanburi Province amount 101 persons. The instrument were questionnaire consisting of 4 parts are as follows : (1) the personal characteristics questionnaire, (2) the emotional quotient questionnaire, (3) the ethics questionnaire and (4) the adversity quotient questionnaire.

The statistical analysis used are frequency, percentage, arithmetic mean, standard deviation, Pearson’s Product Moment Correlation and Stepwise Multiple Regression Analysis. The results of this study are as follows :

1. There was a statistically significant high level of emotional quotient at .05 level, with the average of 3.80.
2. There was a statistically significant high level of ethics at .05 level, with the average of 5.39.
3. There was a statistically significant high level of adversity quotient at .05 level, with the average of 4.07.
4. There was a statistically significant positive correlation between emotional quotient and ethics at .05 level. ( $r = .826$ )
5. There was a statistically significant positive correlation between emotional quotient and adversity quotient at .05 level. ( $r = .287$ )

6. There was no significant correlation between ethics and adversity quotient.

7. The stepwise multiple regression analysis revealed that emotional quotient toward self-regulation, emotional quotient toward empathy and adversity quotient toward control. These variables were significant predictors for ethics with a total predictability of 73.40%.
