ABSTRACT (THAI).....	(i)
ABSTRACT (ENGLISH).....	(ii)
CONTENTS.....	(iii)
LIST OF TABLES.....	(vii)
LIST OF FIGURES.....	(viii)
LIST OF SYMBOLS.....	(xii)
 CHAPTER 1 INTRODUCTION.....	 1
1.1 Research problem and its significance.....	1
1.2 Objectives.....	2
1.3 Scope of research.....	3
1.4 Expected benefits.....	4
 CHAPTER 2 LITERATURE REVIEW.....	 5
2.1 Introduction.....	5
2.2 Dielectric properties.....	8
2.2.1 Dielectric theories.....	8
2.2.2 Measurement techniques and calculation.....	10
2.2.2.1 Measurement techniques.....	10
2.2.3 Measurement of cement and concrete.....	13
2.2.4 Measurement of blended cement and concrete.....	15
2.2.5 Modeling work.....	17
2.3 Microwave systems.....	18
2.4 Applications of microwave to cement.....	24
2.4.1 Cement synthesis.....	24
2.4.2 Improving cementitious properties.....	25
2.5 Applications of microwave to concrete.....	25
2.5.1 Acceleration of curing.....	25
2.5.2 Decontamination and decommissioning of concrete.....	30
2.5.3 Nondestructive monitoring.....	31
2.5.4 Drilling/melting of concrete.....	32
2.6 Theoretical investigations of microwave processing.....	33
2.6.1 Electromagnetic theories.....	33

CONTENTS (CONT.)

	Page
2.7 Numerical techniques and simulation	36
2.8 Health and safety of microwave processing	40
2.9 Conclusions	41
2.9.1 Major review findings	41
2.9.2 Future trends of research and development	43
 CHAPTER 3 DIELECTRIC PROPERTIES OF CEMENT AND CONCRETE	 46
3.1 Fundamental of the dielectric properties of microwave and cement-based materials	 45
3.2 Materials and methods	48
3.2.1 Materials used	48
3.2.2 Mixture proportions	51
3.2.3 Testing procedures	53
3.3 Results and discussion	55
3.3.1 Scattering parameters	55
3.3.2 Dielectric permittivity of the constituents of cementitious materials	61
3.3.3 Dielectric permittivity of pastes, mortars, and concretes	63
3.4 Conclusions of this section	66
 CHAPTER 4 MICROWAVE HEATING OF CONCRETES AND REINFORCED CONCRETE	 67
4.1 Introduction	67
4.2 Extended scope of the research	67
4.3 Materials and methods	68
4.3.1 Materials used	68
4.3.1.1 Characterization of starting cementitious materials	68
4.3.2 Mixture proportions	68
4.3.3 Mixing and molding	72
4.3.4 Microwave curing setup	72
4.3.5 Equipment and procedures	74
4.3.5.1 Scanning Electron Microscope (SEM)	74
4.3.5.2 Microscopes: Powder X-ray Diffraction (XRD)	74
4.3.5.3 Thermal Analysis	74

CONTENTS (CONT.)

	Page
4.3.5.4 Axial and unconfined load compressive strength	75
4.4 Results and discussion	76
4.4.1 Influence of the mix proportions of reinforced cementitious materials	76
4.4.2.1 Water-to-solid mass ratios (w/s)	76
4.4.2.2 Pozzolan materials in reinforced cement paste	86
4.4.2.3 Reinforced mortar and concrete	94
4.4.2 Effects of microwave processing	101
4.4.2.1 Delay times	101
4.4.2.2 Power levels and application times	111
4.5 Concluding remarks	118
CHAPTER 5 A THEORITICAL MODEL TO PREDICT THE PROPERTIES OF THE REINFORCED CEMENT-BASED MATERIALS WHEN SUBJECTED TO MICROWAVE ENERGY	
5.1 Electromagnetic theory	119
5.2 Numerical analysis	121
5.2.1 Analysis of dielectric properties	123
5.2.2 Analysis of heating problem: Conduction mode of heat transfer	123
5.2.2.1 Assumptions	124
5.2.2.2 Basic equations	124
5.2.2.3 Boundary conditions	125
5.2.2.4 Numerical solution program	125
5.2.2.5 Parameters used to calculate	127
CHAPTER 6 CONCLUSIONS AND RECOMMENDATIONS FOR FUTURE STUDY	
6.1 Conclusions	130
6.1.1 Dielectric permittivity of reinforced cement-based materials	131
6.1.2 Microwave-assisted curing of pastes and concretes	131
6.1.3 A theoretical model to predict the heat transfer of reinforced cement paste subjected to microwave energy	132
6.2 Recommendations for future study	132

APPENDIX	144

LIST OF TABLES

	Page
2.1 Cement consumption growth by region (year over year) (%) [1].....	5
2.2 A summary of the technique for measuring dielectric properties [20,21].....	11
2.3 Dielectric constant () and dielectric loss factor () of cementitious materials as function of temperature [27].....	15
3.1 Chemical composition of the materials used (% by mass).....	48
3.2 Specific gravity and surface area of the materials used.....	49
3.3 Specific gravity and absorption of aggregates.....	50
3.4 Mixtures used (by weight in grams).....	52
3.5 IEEE Radar Band Designations.....	56
3.6 Dielectric constant (ϵ') and loss factor (ϵ'') of constituents.....	62
4.1 Mixtures used (by weight in grams).....	70
4.2 Mixtures used (by weight in grams) with conventional curing.....	70
4.3 Mixtures used (by weight in grams) with microwave energy.....	71
5.1 Dielectric permittivity of ICW/S_0.38 paste.....	123
5.2 Variables used for calculation.....	127

LIST OF FIGURES

	Page
1.1 Comparison of heat generation and transfer mechanism in (a) conventional, and (b) microwave curing.....	1
2.1 Overview of a conventional cement manufacturing process [2,3].....	6
2.2 Summary of dielectric measuring techniques [21].....	10
2.3 (a) Network analyzer, (b) Schematic of S-parameter test [22].....	12
2.4. Nicholson–Ross–Weir conversion process for calculating dielectric permittivity [23].....	13
2.5 Correspondent conductivity and heat of hydration for type 1 0.4-w/c cement paste [26].....	14
2.6 Microwave system diagram.....	18
2.7 (a) Experimental set up, (b) schematic showing direction of microwave components (Incident wave, reflected wave, and transmission wave) [47,48].....	20
2.8 Microwave system typed multimode resonant cavity: (a) A combined multi-feed microwave-hot air heating with continuous belt system (Low temperature multi-mode microwave system) [49], (b) High temperature multi-mode microwave system [50].....	22
2.9 A typical microwave drill operating system [12].....	32
2.10 Microwave heating model. (a) Multi-mode cavity [118] (b) Single mode cavity [47].....	38
2.11 A physical model and boundary conditions of 0.38-w/c cement paste subjected to microwave energy using a multi-mode cavity [119].....	40
2.12 A proposed schematic model of cement and concrete subjected to microwave energy.....	45
3.1 Particle size distributions of Type I Portland cement OPC and FA.....	49
3.2 A network analyzer (open ended probe technique) (R = reflected power, T = transmitted power).....	53
3.3 Nicholson–Ross–Weir for calculating dielectric permittivity.....	54
3.4 S_{11} and S_{21} values of cement pastes with different water-to-cement ratios.....	57
3.5 S_{11} and S_{21} values of cement pastes with different pozzolan materials.....	58
3.6 S_{11} and S_{21} values of mortar and concrete.....	60
3.7 Dielectric permittivity of pastes with different water-to-cement ratios.....	64
3.8 Dielectric permittivity of pastes with different pozzolan materials.....	65
3.9 Dielectric permittivity of paste, mortar and concrete.....	66

LIST OF FIGURES (CONT.)

	Page
4.1 (a) Experimental set up and (b) schematic showing direction of microwave components (Incident wave, reflected wave, and transmission wave), and (c), (d), (e) are the positions of thermocouples.....	73
4.2 Universal testing machine.....	75
4.3 Temperature and power history during applying microwave energy of various cement pastes with different water-to-solid mass ratios.....	77
4.4 Micrographs of various cement pastes with different water-to-solid ratios at 4 hours subjected to lime-saturated deionized water curing and microwave energy.....	78
4.5 Spectrums of various cement pastes with different water-to-solid ratios at 4 hours subjected to normal curing (lime-saturated deionized water) and microwave energy.....	80
4.6 Atom ratio of Si/Ca versus Al/Ca of the pastes of 1CW/S_P0.25, 1CW/S_P0.38 and 1CW/S_P0.45 after applying microwave energy power 100 watt for 30 minutes.....	82
4.7 X-ray diffraction of the pastes of 1CW/S_P0.25, 1CW/S_P0.38 and 1CW/S_P0.45 after applying MW power 100 watt for 30 minutes.....	83
4.8 Compressive strengths of the pastes of 1CW/S_P0.25, 1CW/S_P0.38 and 1CW/S_P0.45 after applying microwave power 390 watt for 45 minutes compared to normal curing.....	84
4.9 Thermogravimetric analysis (TG) by comparison among different temperatures and weights.....	85
4.10 Temperature and power history during applying microwave energy of various cement pastes mixed with pozzolan materials.....	87
4.11 Micrographs of various cement pastes mixed with pozzolan materials with different water-to-cementitious ratios at 4 hours subjected to normal curing (lime-saturated deionized water) and microwave energy.....	89
4.12 Atom ratio of Si/Ca versus Al/Ca for the pastes of 2AP_0.38FA20, 2CAP_0.38MK20 and 2CAP_0.38SF20 after applying microwave power 100 watt for 30 minutes.....	90
4.13 X-ray diffraction of 2CAP_0.38FA20, 2CAP_0.38MK20 and 2CAP_0.38SF20 after applying microwave power 100 watt for 30 minutes.....	91

LIST OF FIGURES (CONT.)

	Page
4.14 Compressive strengths of the pastes of CAP_0.38FA20, 2CAP_0.38MK20 and 2CAP_0.38SF20 after applying microwave power 100 watt for 30 minutes compared to normal curing.....	92
4.15 Thermal analysis results by comparison among among different temperatures and weights of the pastes with/without pozzolan materials.....	93
4.16 Temperature and power history during the application of microwave energy to an inside of the mortar sample (3CAM0.38_1:2.75) with different microwave power levels.....	95
4.17 Temperature and power history during the application of microwave energy to concrete (3CAC0.38_1:1:1) with different microwave power levels.....	96
4.18 Micrographs of mortar and concrete with different microwave power levels.....	97
4.19 Atom ratio of Si/Ca versus Al/Ca of cement paste, mortar and concrete after applying microwave energy with different power levels.....	98
4.20 X-ray diffraction of mortar after applying microwave energy with different power levels.....	99
4.21 X-ray diffraction of concrete after applying microwave energy with different power levels.....	99
4.22 Compressive strengths of mortar after applying microwave energy with different power levels.....	100
4.23 Compressive strengths of concrete after applying microwave energy with different power levels.....	100
4.24 Temperature and power history during applying microwave energy of reinforced cement pastes at a water-to-solid material of 0.38 with vary delay times.....	102
4.25 Temperature and power history during applying microwave energy of reinforced FA- cement paste at a water-to-solid material of 0.38 with vary delay times.....	102
4.26 Temperature and power history during applying microwave energy of reinforced MK-cement pastes at a water-to-solid material of 0.38 with vary delay times.....	103
4.27 Temperature and power history during applying microwave energy of reinforced SF-cement pastes at a water-to-solid material of 0.38 with vary delay times.....	103

LIST OF FIGURES (CONT.)

	Page
4.28 Micrographs of various cement pastes at different delay times.....	104
4.29 Atom ratio of Si/Ca versus Al/Ca of various cement pastes with different delay times when applying microwave energy.....	105
4.30 X-ray diffraction of 1CW/S_P0.38 cement paste with different delay times when applying microwave energy.....	106
4.31 X-ray diffraction of 2CAP_0.38FA20 reinforced cement pastes with different delay times when applying microwave energy.....	106
4.32 X-ray diffraction of 2CAP_0.38MK20 reinforced cement pastes with different delay times when applying microwave energy.....	107
4.33 X-ray diffraction of 2CAP_0.38SF20 reinforced cement pastes with different delay times when applying microwave energy.....	107
4.34 Compressive strengths of 1CW/S_P0.38 reinforced cement paste with different delay times when applying microwave energy.....	108
4.35 Thermogravimetric analysis (TG) results by comparison among different delay times.....	110
4.36 Temperature and power history during applying microwave energy of various reinforced cement pastes with different power levels and times of application.....	112
4.37 Micrographs of 1CW/S_P0.38 reinforced cement pastes with different power levels and application times of microwave energy.....	113
4.38 Atom ratio of Si/Ca versus Al/Ca of the pastes of 1CW/S_P0.25, 1CW/S_P0.38 and 1CW/S_P0.45 with different power levels and application times of microwave energy.....	114
4.39 X-ray diffraction the pastes of 1CW/S_P0.38 with different power levels and application times of microwave energy.....	116
4.40 Compressive strengths the reinforced pastes of 1CW/S_P0.25, 1CW/S_P0.38 and 1CW/S_P0.45 with different power levels and application times of microwave energy.....	116
5.1 Electromagnetic wave propagation.....	121
5.2 The distribution of microwave radiation in the XZ plane.....	123
5.3 Mode predefines combinations of application modes and couplings for electro-thermal interaction.....	126
5.4 Temperature history of the 1CW/S_0.38 paste when applying microwave power 100 watt on a period of 30 minutes.....	129

LIST OF SYMBOLS

Nomenclature

\bar{B}	magnetic flux density (Wb/m^2)
\bar{D}	electric flux density (C/m)
D_p	penetration depth (m)
\bar{E}	electric field intensity (V/m)
\bar{H}	magnetic field intensity (A/m)
L	material length
\bar{P}	energy flux density (W/m^2)
Q	local electromagnetic heat-generation (J)
T	temperature ($^\circ\text{C}$)
S_{11}	reflected scattering coefficient from Port 1
S_{22}	reflected scattering coefficient from Port 2
S_{21}	transmitted scattering coefficient from Port 1
S_{12}	transmitted scattering coefficient from Port 2
V	volume (m^3)
a	thermal diffusivity (m^2/s)
c_p	heat capacity at constant pressure ($\text{J}/(\text{kg}\cdot\text{K})$)
f	frequency (Hz)
q	electric charge density (C/m^3)
t	time (s)
e	Euler's number ($= 2.7182818\dots$)

Greek letters

Γ	reflection coefficient
σ	effective conductivity (S/m)
ϵ_0	permittivity of free space ($= 8.8514 \times 10^{-12}$) (F/m)
ϵ_∞	permittivity at the high frequency limit
ϵ_s	static, low-frequency permittivity
ϵ^*	complex (electric) permittivity, $\epsilon' - j\epsilon''$
ϵ_r	relative permittivity
ϵ_r'	relative dielectric constant

ϵ_r''	<i>relative dielectric loss factor</i>
μ^*	<i>complex magnetic permeability, $\mu' - j\mu''$</i>
μ_0	<i>permeability of free space ($= 4\pi \times 10^{-7}$) (m·kg/s².A²) or (h/m)</i>
μ_r	<i>relative permeability</i>
v	<i>microwave speed in the dielectric material (m/s)</i>
ω	<i>angular frequency, field's frequency (s⁻¹)</i>
$\tan \delta$	<i>loss tangent coefficient (ϵ'' / ϵ')</i>
σ	<i>electric conductivity (1/Ohm)</i>
τ	<i>characteristic relaxation time (s)</i>
ρ	<i>density (kg/m³)</i>
λ_g	<i>wavelength in sample.</i>
$\lambda_{\text{free space}}$	<i>wavelength of free space</i>
λ_{cutoff}	<i>wavelength of cutoff frequency</i>
