Abstract

This research was to study the situations, problems and needs of computer for learning and teaching of nursing institutes in Thailand. The sample of this study consisted of 935 teachers from the institute of nursing which were selected by stratified random sampling technique.

The research tools were the constructed questionnaires which were divided into two parts; check list and rating scale. Statistics applied in the study were percentage, mean and standard deviation. F-test and t-test were also used to examine the data for significant differences.

The result of this study indicated that most nursing institutes have very small number of computer lecturers. Most lecturers have insufficient knowledge and skill for teaching, they also have less time for using computers which are not enough for practice. Therefore, lecturers require adequate number of computers, for their offices.
