ABSTRACT

Nowsday, People in the city state must go to work outside of the house and turn back in the evening, during that period no one is at home. Incident may happen with property at home by thief or fire. The thesis presents the telephone emergency call system via radio pager network by applied pager that persons to admire to use with emergency system. It is a guard electronics. When the signal from emergency detectors is detected by central processing unit and the unit initiales a call to pager network and consign emergency massage to pager of owner house. It can programe to call more than one pager in the same or different pager system. The design not only emphasizes on using the component that easy to find in the local market but low price also. This development can be produced by local industrial in Thailand.
