Asst.Prof. Surat Promchun  
Academic Year : 1995

#### Abstract

The study aims to find contributing factors in the academic cooperation of science and technology institutes and production industries located in industrial estates in Bangkok and outlying areas.

Questionnaires were sent to 152 sites. 132 valid questionnaires were returned accounting for 86.84%. The returns were subjected to statistical analysis to find percentage, means and standard deviation.

The results show that subjects see type of cooperation as the most important aspect of cooperation, followed by cooperation in research and development.

On academic cooperation, staff is the most important followed by equipment and machinery.

The respondents also would like industrial specialists to have a role in teaching or advise the project, followed by the qualification and ability of instructors and project personnel.
