The purpose of this research was to develop and implement the
environmental education training curriculum on air and noise pollution from motor
vehicles for Nakhon Pathom Traffic Policemen, Nakhon Pathom Province. Their
achievement before and after the training was tested both immediately after and one
month after the training.

The population for this study were 126 Nakhon Pathom traffic policemen.
The sample consisted of 30 policemen. They were tested both before and after the
training. Post-tests were administered two times immediately and one month after
the training for retention test. Those test results were compared and tested by
t-test statistic.

The results of this research revealed that the sampling of policemen had
gained knowledge and changed attitudes significantly on air and noise pollution
from motor vehicles. Results from post-tests were also different significantly at 0.05
level. This result meant that their retention was not that good. They expressed high
level of satisfaction on the training course.

It is suggested that after training a curriculum should be implement for
all policemen using equipment and laws to prove their knowledge.
