#### Abstract

The study aimed at evaluating job training program of Diploma students in the field of Building Construction of Technical Colleges in the Southern part of Thailand.

The CIPP model was employed with three groups of populations as follows : 137 administrators, 123 related staff and 284 students who had participated in the program in 1988. The tools used for data collection were structured interview form and sets of questionnaires. Data were analyzed by means of subject matter analysis, percentage, arithmetic means, and standard deviation.

The outcome of the study revealed that in general, the program was conducted appropriately in terms of the program rationale and objectives. Some recommendations for improvement were that the period of training should be two months; the training supervision of teacher should be conducted once a month; essential facilities such as transportation, and per-dium should be sufficiently provided; and the evaluation should be conducted only by the training supervisor from industry.
