Date of Graduation 27 May B.E. 2536 (1993)

ABTRACT

The purpose in this study was to examine the effect of Music Therapy to the degree of depression in the Cripple Children. The sample consisted of 14 children aged between 11-15 years old. Instrument employed in this study was Children's Depression Inventory (CDI), obtained data were analyzed by using t-test. The result found that there were no statistical differences at .05 level in any comparison group. However, considered the mean scores of CDI before and after experimental process, it was found the reduction of depression scores. Moreover, it was found tendency of subjects to have good impression to Music Therapy.
