#### ABSTRACT

The main objective of this research was to construct and develop a distance training module on "Value clarification" to upgrade teaching efficiency of population education in prathom 5 and 6. The process of construction was divided into four steps. The first step was to analyse the content of the distance training module, the second step was to construct distance training module the third step was to construct and develop the pre and post test and the final step was to test standard effectiveness of the distance training module using the criteria 90/90. Data were collected from a total sample of 60 teachers in prathom 5 and 6, and were divided into two group : 30 teachers for the experiment of the distance training module; and 30 teachers for control group. The finding were as follows.

The effectiveness of the three parts of distance training module were 90/86, 87/85 and 88/87 respectively. All of them were lower than standard criteria but they were acceptable. The analysis of the arithmetic means of the pretest and posttest of the three parts of the distance training module, the results indicated that there were statistically significant different at 0.05 and 0.01 respectively. It could be concluded that the distance training module was significantly improved the teachers' knowledge on value clarification.
