ABSTRACT

The purposes of this research were to study and compare the problems of students in using internet under the institute of vocational education central region 4

Population were 21,644 first year students from colleges in the institute of vocational education central region 4 . The samples comprised of 377 students in first semester of academic year 2548. They were selected by stratified random sampling. The questionnaire was examined by 3 specialists, It consisted of 32 questions and was improved the content to cover the definitions. It was completely tested with 50 students from the institute of vocational education central region 4 for finding the value of the reliability by calculation the alpha coefficient of Cronbach. The reliability of the questionnaires was 0.92. The data analysis used the statistics to analyze in order to find the frequencies, percentage, means, standard deviation and t-test. The results of the study were the following :

1. The problems of students in using the internet were at high level. ranging the mean value form high to low levels as followed: (1) the facilities in using the internet, (2) the internet access, (3) the policy supporting and servicing the internet, (4) the skills and knowledge of using the internet, and(5) the period of using the internet,

2. The problems of students in using the internet during The higher vocational certificate students and vocational certificate levels were statistically significant difference at .05 level as a whole.

3. The problems of students in using the internet of the urban students and the suburb students were not different aspect from each other with statistical signifiacnce at .05 level.
