ABSTRACT

This research aimed to develop a student record management system using collaboration software to manage the information that relates to the status of graduate students.

The original system was a manual one operated by administrative staff in this section. This caused data errors. There was no clear pattern for data storage. Therefore, we used Microsoft Sharepoint 2010TM to develop a new system.

The systematically stores the data, is easier, faster to use, and helps management to ensure information is accurate and secure.
