RESULTS AND DISCUSSION	41
CONCLUSION	63
LITERATURE CITED	65

LIST OF TABLES

Table		Page
1	Membrane separation processes, process driving forces and applications.	2
2	Energy requirements for dehydration of ethanol	6
3	Classification of water-permselective PV membranes in water/ethanol pervaporation separation.	13
4	Composition of casting solutions and membrane formation conditions.	30
5	Normalized flux and selectivity values of different membranes for different feed compositions (membrane thickness: 20-30 μm).	42
6	Results of Casting solutions prepared in this study.	43
7	Water permeate flux and selectivity for water dehydration pervaporation.	51

LIST OF FIGURES

Figure		Page
1	Membrane separation showing the retentate and permeate by pressure-based separation processes.	2
2	Schematic diagram of the pervaporation process.	3
3	The solution-diffusion model for pervaporation.	4
4	Metrohm Titrino model 701 KF for determination of water concentration by Karl Fischer method.	25
5	Schematic of general procedure for production of membranes by the phase inversion process.	26
6	Membrane casting.	28
7	Membrane formation by phase inversion method.	28
8	Membrane formation by evaporation.	29
9	Schematic diagram of the test cell set up used in this study.	38
10	Membrane module (a), set up for pervaporation membrane process (b), for dehydration of water of ethanol water azeotropic mixture in this study. prepared polymeric membrane (c), for polysulfone membranes.	44
11	Water permeate flux as a function of time of the prepared polymeric membranes.	46
12	Water content in the retentate of hydrophilic poly(vinyl alcohol), PVA, and in hydrophobic poly(sulfone), PSF.	56
13	Water content in the retentate of PVAE, PVA and PSF.	57
14	Water content in the retentate of PSF, PVAE, PVAE-PSF and PVA.	57
15	Selectivity of cross-linked PVA and non-crosslinked PVA membranes.	58
16	Water content in the retentate in PVA, X-PVA, PVAE-PSF, PVAE and PSF with increases wt% of polymer.	59
17	The relationship between water permeates flux and selectivity with the composition of feed mixture.	60

LIST OF FIGURES (Continued)

Figure		Page
18	Water permeate flux and selectivity of PSF(---) and PSF-ME (-).	61
19	Permeate flux of prepared polymeric membranes at 10 wt% polymer concentrations.	62
20	Selectivity of prepared polymeric membranes at 10 wt% polymer concentrations.	62

LIST OF ABBREVIATIONS

RO	=	Reverse Osmosis
EtOH	=	Ethanol
PVA	=	Poly(vinyl alcohol)
PVAE	=	Poly(vinyl alcohol-co-ethylene)
PSF	=	Polysulfone
NMP	=	N-Methyl-2-pyrrolidone
DMSO	=	Dimethyl sulfoxide,
PV	=	Pervaporation process
KF	=	Karl Fischer method
J	=	Selectivity
PSI	=	pervaporation separation index
Q	=	quantity of the permeate
A	=	effective membrane area
PVP	=	poly vinyl pyrrolidone
