The objective of this experimental research was to formulate and implement the environmental education training curriculum on utilization of pesticides for village health volunteers (VHVs). The study was conducted in 3 steps;

- 1) The preparation of training curriculum.
- 2) The environmental education training curriculum formulation.
- 3) The implementation process and program evaluation.

The samples were 60 VHVs who were divided to 2 groups, the experimental group and the control group. The experimental group received 2 days training. The program evaluation was evaluated by the questionnaires of knowledge, attitude, and satisfaction of training. Statistics used for data analysis were descriptive statistics : percentage, mean, and analytical statistics: t-test and paired t-test.

The finding of this study showed that before the experiment, the knowledge and attitude means of the experimental and control groups were not significantly different at 0.05. After the experiment, the knowledge and attitude means of the experimental group were significantly increased at 0.05, and the attitude mean of the control group was not significantly different. The trainees were satisfied with the environmental education training curriculum.
