APPENDIX B : Synthesis of NH₂-*ae*gPNA-thymine-COOH and study of reactivity of 2-vinyl-4,4-dimethyl-5-oxazolone (VDM)

Synthesis of methyl 2-(2-(*tert*-butoxycarbonylamino)ethylamino)acetate (**62**) [89]

Scheme 35 Synthesis of methyl 2-(2-(*tert*-butoxycarbonylamino)ethylamino)acetate (**62**)

To a solution of ethylenediamine (**36**) (9.60 mL, 159.1 mmol) in anhydrous CH₂Cl₂ (30 mL) cooled in an ice bath, was added dropwise over period of 5 h. to a solution of di-*tert*-butyldicarbonate (**60**) (4.43 g, 20.29 mmol) in anhydrous CH₂Cl₂ (20 mL). After stirring overnight, the reaction mixture was washed with water (5 x 120 mL), dried over anhydrous Na₂SO₄, concentrated, and dried *in vacuo* to give crude product of *tert*-butyl 2-aminoethylcarbamate (**61**) as an oil. Without further purification, **61** (1.8 g, 11.23 mmol) was dissolved in anhydrous CH₂Cl₂ (30 mL), and diisopropylethylamine (DIEA) (1.95 mL, 11.79 mmol) was added. Then, a solution of methyl bromoacetate (**42**) (1.06 g, 11.79 mmol) was added dropwise over 1 h. The resulting solution was stirred at room temperature approximately 18 h. and washed with brine (5 x 30 mL). The organic layer was dried over anhydrous Na₂SO₄, filtered and and dried *in vacuo* to produce of **62** as a white solid in 40 % yield for two steps.

¹H NMR 400 MHz (CDCl₃) δ 4.87 (br, 1H, NH), 3.74 (s, 3H, CH₃), 3.60 (s, 2H, CH₂), 3.20 (t, 2H, CH₂, *J* = 6.3 Hz), 2.89 (t, 2H, CH₂, *J* = 6.2 Hz), 1.85 (br, 1H, NH) 1.35 (s, 9H, C(CH₃)₃)

Synthesis of Boc-*aeg*PNA-thymine-methyl ester monomer (**63**) [89]

Scheme 36 Synthesis of Boc-*aeg*PNA-thymine-methyl ester monomer (**63**)

To a solution of **62** (0.50 g, 2.30 mmol) in anhydrous DMF (5 mL), was added DIEA (0.59 mL, 4.6 mmol), thymine-1-ylacetic acid (**44**) (0.51 g, 2.76 mmol), HATU (1.67 g, 4.42 mmol), and 2,6-lutidine (0.95 mL, 8.28 mmol). The reaction mixture was stirred for 8 h. at room temperature and then concentrated *in vacuo*. The residue was brought up in CH₂Cl₂ and washed with saturated NaHCO₃ (5 x 30 mL) and brine (5 x 15 mL). The organic layer was dried over anhydrous Na₂SO₄ and concentrated *in vacuo*. The crude product was purified by column chromatography (19:1 CH₂Cl₂/MeOH). The desired product (**63**) was obtained as a white solid in 74 % yield: R_f = 0.45 (9:1 CH₂Cl₂/MeOH)

¹H NMR 400 MHz (CDCl₃) δ 8.51 (br, 1H, NH), 6.97/6.83 (rotamer s, 1H, Ar), 5.63/5.38 (rotamer br, 1H, NH), 4.53/4.38 (rotamer s 2H, CH₂), 4.21/4.10 (rotamer s, 2H, CH₂), 3.76 (s, 3H, CH₃), 3.49 (t, 2H, CH₂, *J* = 6.4 Hz), 1.86/1.85 (rotamer s, 3H, CH₃), 1.64/1.46 (rotamer s, 9H, C(CH₃)₃)

Synthesis of Boc-aegPNA-thymine-COOH (64)

Scheme 37 Synthesis of Boc-aegPNA-thymine-COOH (64)

A suspension of **63** in 4 M NaOH was stirred for 45 min at room temperature. The reaction mixture was cooled to 0 °C and pH was adjusted to 2 with 2 N HCl. The aqueous solution was extracted with ethyl acetate (3 x 30 mL). The organic layer was dried over anhydrous Na₂SO₄ and concentrated *in vacuo*. The desired product (**64**) was obtained as a white solid in 79 % yield.

¹H NMR 400 MHz (CDCl₃) δ 8.87 (br, 1H, NH), 6.97/6.83 (rotamer s, 1H, Ar), 5.62/5.38 (rotamer br, 1H, NH), 4.54/4.38 (rotamer s 2H, CH₂), 4.20/4.10 (rotamer s, 2H, CH₂), 3.49 (t, 2H, CH₂, *J*=6.3 Hz), 1.83/1.84 (rotamer s, 3H, CH₃), 1.63/1.48 (rotamer s, 9H, C(CH₃))

Synthesis of NH₂-aegPNA-thymine-COOH (65)

Scheme 38 Synthesis of NH₂-aegPNA-thymine-COOH (65)

A portion of desired Boc-*aeg*PNA methyl ester monomer (**64**) (200 mg) was treated with a 2:1 (V/V) mixture of TFA:CH₂Cl₂ (2 mL). The reaction mixture was stirred at the room temperature for 3 h. and was co-evaporated with toluene. The resulting crude product was dried *in vacuo* to remove TFA. The crude oil was washed with diethyl ether and dried *in vacuo*. The desired product (**65**) was obtained as a white-yellow solid in 74 % yield.

¹H NMR 400 MHz (CDCl₃) δ 8.85 (br, 1H, NH), 6.96/6.84 (rotamer s, 1H, Ar), 4.53/4.37 (rotamer s 2H, CH₂), 4.23/4.12 (rotamer s, 2H, CH₂), 3.50 (t, 2H, CH₂, *J*=6.2 Hz), 3.13(s, 2H, CH₂), 1.75 (s, 3H, CH₃)

Reactivity of amine and hydroxyl groups of *aeg*PNA with VDM

To a solution of **65**, VDM in anhydrous DMF (5 mL) was added. The reaction mixture was stirred at room temperature for 8 h. Then, the reaction mixture was concentrated *in vacuo* to give **66** as mastic solid and reaction were followed up by ¹H-NMR 400 Hz as shown in figure 90.

Scheme 39 Reactivity of amine and hydroxyl groups

Figure 90 ^1H -NMR spectrum of (a) $\text{NH}_2\text{-aeg-thymine-COOH}$ (65),
(b) Product of reaction (66) (CDCl_3)

Optimization of VDM with hydroxyl groups of Boc-aegPNA-T-COOH

To a solution of **64** and VDM (29) (Table 8) in anhydrous DMF (5 mL) was added. The reaction mixture was stirred at room temperature for 8 h. Then, the reaction mixture was concentrated *in vacuo* to give crude product as white solid and was followed up by ^1H -NMR 400 Hz as shown in figure 91.

APPENDIX C : Extinction coefficient of carbazole derivative acetic acid and coupling efficiency of each monomer

Determination of extinction coefficient of carbazole derivatives

Stock solutions of *aeg*PNA oligomers in water were quantitated by measuring the absorbance at 260 nm using the following values for the extinction coefficients of individual residues for PNA, A=13,700, C=6,600, G=11,700, and T=8,600 l.mol⁻¹cm⁻¹. The extinction coefficients for carbazole derivative were obtained from the experiment as described.

A stock solution approximately ~10 mM of carbazole derivatives in 100 mL of 100 mM NaHCO₃ was prepared. Next, the stock solutions were diluted with 100 mM NaHCO₃ to give three different concentrations (for example: 0.01 mM, 0.02 mM, and 0.03 mM). Then, each diluted solution was heated at 55 °C for at least 1 minute. The absorbance of the solution was then measured at 260 nm. The average of the three absorbance measurement was used to calculate the extinction coefficients using Beer's law (eq : 4):

$$A = \epsilon bc \quad (4)$$

Where: A = absorbance
 ϵ = extinction coefficient (l.mol⁻¹.cm⁻¹)
 b = path length of the cell (cm)
 c = concentration of the solution (mol.l⁻¹)

Extinction coefficient was determined from three concentrations. The three extinction coefficients were averaged, and this averaged value was used in the quantitation of PNA oligomer concentrations.

Table 9 Extinction coefficient of carbazole derivative

Compounds	Extinction coefficient ($\text{l.mol}^{-1}.\text{cm}^{-1}$)
carbazole acetic acid (42)	18,239
3,6- dicyanocarbazole acetic acid (48)	20,283
3,6- dinitrocarbazole acetic acid (50)	18,533

The coupling efficiency of each monomer

To check the effectiveness of each coupling step, the solution consists of dibenzofulvene and 20 % piperidine in anhydrous DMF was measured with UV-vis spectrometry at 290 nm. The first absorbance of the solution from the first loading of Fmoc-*aeg*PNA-resin, was assumed to be 100%. The efficiency should be up to 95 % for each step in order to give acceptable yield.

The *aeg*PNA oligomer was synthesized according to protocol using MBHA-resin (10 mg, 1.0 μmol). The coupling efficiency of each monomer was shown in the table C1.

Table 10 The coupling efficiency of each monomer

Code	Cycle	Monomers	A ₂₉₀	Coupling efficiency (%)
